

## 2.2.2: R - Linear Regression Remedial Measures

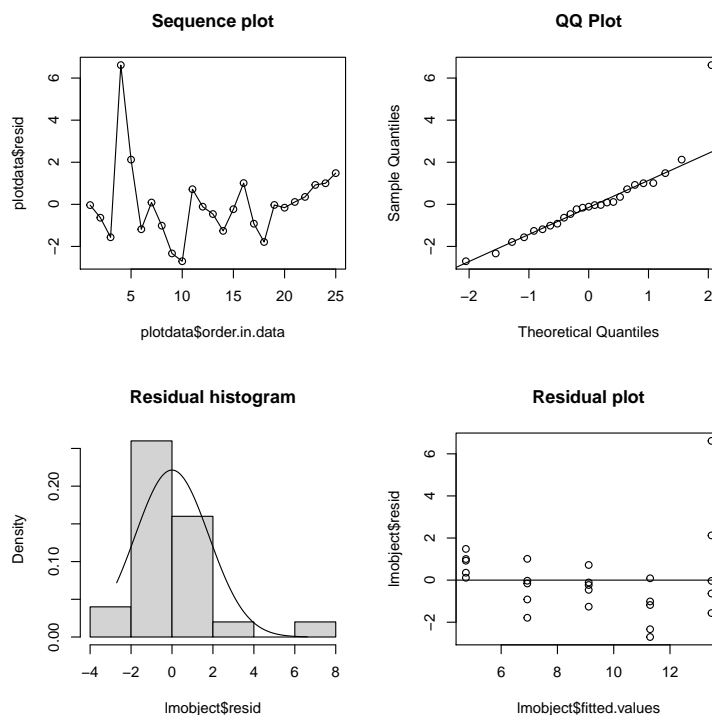

Stat 5100: Dr. Bean

**Example:** Age and plasma levels for 25 healthy children in a study are reported. Of interest is how plasma level depends on age.

```
# Load data
library(stat5100)
data(plasma)

# Fit regression model and check assumptions
plasma_lm <- lm(level ~ age, data = plasma)

# Check visual assumptions
# (Note: this is a new function you haven't seen before, all this one does
# is it combines the work from seq_plot, qq_plot, residual_hist, and
# residual_plot into one single image)
stat5100::visual_assumptions(plasma_lm)
```

```
# Check assumptions with numerical tests
stat5100::brown_forsythe_lm(plasma_lm)

## [1] "Brown-forsythe test for constant variance in the residuals:"
## [1] "T-statistic: -1.6903, p-value: 0.1045"
```

```
